

Feasibility funnel — near-ground scenario, asynchronous run (bar length is logarithmic)

Exact counts recovered from the archived per-candidate evidence streams of a single run: PlanCapture (grasp screens and named rejection reasons), TransitRoute (per-route outcomes), GlobalPlanCost (cost validity) and the timing-frontier replay. The dominant grasp-screen rejection reasons are IK non-convergence (134) and fingertip-vs-object clearance (154); the dominant route rejections are the runtime clearance reserve (61) and the robust transit clearance reserve (41). The terminal timing audit is a cost-validity precondition rather than a separately logged stage.
